Cirprotec, your protection partner

SPECIALIST IN LIGHTNING AND SURGE PROTECTION

Pioneers in the **design and manufacture of lightning and surge protection devices**, Cirprotec has been manufacturing high quality solutions and products for over 25 years using the most innovative technologies. Cirprotec's leadership in this field is supported by its clear **commitment to innovation** and the latest trends. An example of this is the new nimbus® PRO lightning rod series, an online IOT **cloud-based monitoring system**, for convenient monitoring of events and maintenance.

SAFETY AND RELIABILITY

- **Bringing together the experience** in the principal international **manufacturing and test standards** for surge protection devices (IEC and UL) and lightning rods (NF C and UNE).
- **Innovative product ranges combining surge protection and grounding system monitoring** to provide full safety and service continuity. SAFEGROUND®.
- **A world-class laboratory for lightning and surge protection testing**, with accreditations to IEC/EN 61643-11, EN 50550, UL 1449 4th edition, NF C 17-102 and UNE 21186, etc.

WORLD-CLASS LIGHTNING AND SURGE TEST PLATFORM

Cirprotec is committed to innovation. More than 35,000 tests over 25 years attest to our commitment to continuous improvement.

In the field of lightning and surge protection, Cirprotec has a highly specialized team, with test laboratories, a high investment in R&Di, international patents and a presence on standards committees.

Cirprotec has two **state-of-the-art overvoltage testing laboratories** (current pulses of **up to 200 kA** in 10/350 lightning and early streamer type waveforms), for the **development and quality assurance** for testing lightning and surge protection systems. These complement the widest possible range of **tests offered according to IEC, UL and NF C standards**.

COMPREHENSIVE PROTECTION

As the Spanish Building Technical Code, based on the UNE 21186 standard, states, **effective surge protection must combine the following protection systems:**

- **External protection** (ESE lightning rods and faradisation). System for protection against direct lightning strike. These capture the lightning within the protected area and lead it, in a controlled manner, safely to earth.
- **Internal protection** (power frequency overvoltage surge protection devices). Equipment designed to protect against the effect of surges due to direct and indirect strikes on equipment connected to the electricity and/or communications network.
- **Earthing system**
Systems that allow atmospheric discharge currents to be dispersed into the ground. The need for monitoring the grounding system.

Cirprotec offers a **wide range of products** for each of these systems. It also provides custom products, advice, consulting and the best after-sales service.

CIRPROTEC GUARANTEES THE SAFETY OF YOUR FACILITIES

Cirprotec designs and manufactures in accordance with the **strictest quality standards and certifies** its products to the most stringent standards (e.g. IEC, EN, UNE-EN, NF C) through independent certifying organisations such as ENAC, UL and Dekra.

Lightning | The need for protection

THE PHENOMENON OF LIGHTNING

At any one time there are about **5,000 active thunderstorms around the world**. Lightning density depends on the terrain and climate, which means it varies from one place to another and from one time of year to another. In Spain, for example, some two million lightning bolts fall to earth, killing a dozen people and hundreds of animals each year.

The **average intensity of a lightning strike** is estimated to be around **20 kA - 30 kA**.

Isokeraunic maps present **historical strike density data** on the ground (Ng) and tabulate it from low to high risk of strike. In Spain, for example, the average isokeraunic level is relatively high, with 2 to 6 strikes/year per km².

HOW LIGHTNING FORMS

Lightning is a **powerful natural discharge** of static electricity, produced **during a thunderstorm** and generating an electromagnetic pulse. Under normal conditions, there is a balance between positive and negative charges in the atmosphere.

- 1 During the formation of a cumulonimbus, there is an increase of ionisation and a **potential difference is generated between the cloud and the ground**, which gives rise to small discharges.
- 2 As the electric field gains in strength, **the descending leader breaks up the dielectric field in the air**.
- 3 Eventually, it manages to break down the layers of the dielectric field in the air and **meets the ascending leader** from the surface.

THE DESTRUCTIVE EFFECTS OF LIGHTNING

The effects of lightning pose a serious hazard to people, property, equipment and structures, and for this reason protection is essential.

Catastrophic consequences for people and animals

The flow of a current of a certain intensity for a short period of time is sufficient to cause electrocution and severe burns to the subject in question, sometimes leading to death.

Substantial financial losses:

- **Damage to buildings.** A direct lightning strike causes damage to structures (e.g. buildings, telecommunications antennas, manufacturing facilities and photovoltaic installations, etc.).
- **Fires.** The formation of sparks and heat dissipation due to the Joule effect can cause fires.
- **Destruction of equipment/service interruption.** An indirect lightning strike generates surges which damage equipment connected to the electrical network, telephone network, Ethernet, etc.

Source: AVIVA 2012

Lightning | Effective protection

REGULATORY FRAMEWORK

The destructive capacity of lightning makes it necessary to assess the need for protection, and possibly to install an effective protection system.

In the field of lightning protection, using either ESE lightning rods or faradisation systems, the following principle standards are used:

- **NF C 17-102:** "Protection of structures and open areas against lightning by a lightning rod with early streamer emission device" Internationally used French standard.
- **UNE 21186:** "Protection of structures, buildings and open areas by lightning rods with an early streamer emission device." Spanish standard.
- **UNE-EN 62305, IEC 62305:** "Lightning Protection". European and international standard.
- **Spanish Technical Building Code (CTE) Section SU8:** "Safety from the hazard caused by lightning" defines the need and measures to be taken for lightning protection, and is obligatory in Spain (Real Decreto 314/2006).
- **EN/IEC 62561:2011.** "Lightning protection system components (LPSC)". European and international standard. It consists of 7 parts specifying the requirements of the various components involved in lightning protection. These include cables, clamps, counters, earth rods, earth enhancer compounds and earth inspection pits, among others.

RISK ANALYSIS

To determine the need for lightning protection and the level of protection required for a given facility, the various lightning rod standards specify a risk calculation. This calculation consists of knowing the levels of risk in the event of a lightning strike and its derivatives from parameters related to the facility (e.g. its dimensions, the annual level of lightning strikes, the materials of the structures, the type of wiring, and whether it is a cultural asset or open to the public).

This calculation will determine the need to establish various protection measures to effectively mitigate the risk (lightning rod, surge protection, or others).

PRODUCT CERTIFICATION

Due to its construction and accessibility, an ESE lightning rod is designed for high durability, and accessing and replacing it is usually complicated and expensive. So it is especially important for it to be certified and have undergone tests (mechanical, climate chambers, current impulses) in accordance with the above standards, which guarantee its reliability and robustness.

Product test certifications must be carried out by recognized (accredited) laboratories or entities, in order to ensure that the product complies with the applicable standards and meets the specified safety requirements. Lastly, it is important to have a certification by an external entity which audits the production process, thus guaranteeing its industrial quality.

As a matter of fact, when calculating the protection radius of an ESE lightning rod, the early emission is the only factor that depends on the lightning rod itself rather than on the characteristics of the facility. Which means that the reliable calculation of this value, certified by an accredited lab, is crucial for the correct protection of the facility.

ISOKERAUNIC MAP

Lightning strike density on the ground in Ng (strokes/year · km²)

Lightning protection system

The destructive capacity of the lightning makes it essential to evaluate the need for protection and, perhaps, to install a system to ensure effective protection. The current regulatory framework in each country defines the need for protection and sets out the steps to follow for designing a system which guarantees protection against lightning.

ASSESS THE NEED FOR PROTECTION

The need for protection of a facility is established starting from the evaluation of the **degree of safety** required and **associated risk** factors. Whenever the expected strike frequency (N_e) is greater than the permissible risk (N_a), protection must be installed. The **calculation of the need for protection** is quite complex and depends on the applicable regulatory framework.

Required efficiency (E)	Level of protection	
$E \geq 0.98$	Level 1	Maximum safety
$0.95 \leq E \leq 0.98$	Level 2	High safety
$0.80 \leq E \leq 0.95$	Level 3	Medium safety
$0 \leq E \leq 0.80$	Level 4	Standard safety

Source: CT-DB-SUA8:2010

DESIGNING A PROTECTION SYSTEM (REQUIRED COMPONENTS)

The standards define an effective lightning protection system as a set of equipment and devices to capture (never to attract) lightning and conduct it safely to earth:

- 1 Capture system:** lightning air terminals.
- 2 Down conductor system:** components required to conduct lightning energy in a controlled and safe manner.
- 3 Earthing systems:** components required for dissipating lightning currents. A grounding system is essential for the proper operation of the protection system.
- 4 Surge protection:** devices for protecting electrical and electronic equipment connected to the facility's electrical network or low current networks (communication and information systems) against voltage surges.

CHOOSE THE CAPTURE TECHNOLOGY

Various types of lightning protection systems are available, which may be more or less appropriate depending on the construction features of the facility to be protected, the overall installation costs, etc.

Protection by Faradisation terminals (passive systems)

Standards: UNE EN 62305, IEC 62305 and CTE SU8.

Systems which capture by means of rods and meshes work by distributing and dissipating the lightning discharge current through a network of conductors.

Lightning rod protection with early streamer emission (ESE)

Standards: NF C 17-102, UNE 21186, CTE SU8, NP 4426, etc.

Suitable for any installation type and open areas, where it optimises the material and installation cost while ensuring proper safety.

Design quickly and easily with nimbus® project designer

Free online tool which allows to design external lightning protection systems (need for protection, optimised location of ESE lightning rods) and generates a complete report to attach to the project quote.

nimbus.cirprotec.com

Lightning rods | ESE Technology

THE MOST EFFICIENT SYSTEM

ESE (Early Streamer Emission) technology uses the atmospheric gradient to generate ionization which creates an **upward propagating leader** faster than any Franklin passive rod. The time difference ΔT is the "benefit" of ESE technology and is known as "early emission" (microseconds μs).

By reducing the start time, the streamer can be connected to the descending leader at a **virtually located strike point well above the tip of the ESE lightning rod**. This **substantially increases the protected volume** (or radius) and facilitates the protection of large areas, simplifying and reducing material and installation costs.

Determining the protection radius is key for selecting the model most suitable lightning rod for each facility based on the level of early emission (ΔT).

The main standards governing these devices are NF C 17-102:2011 and UNE 21186:2011. They establish the relationship between the early streamer emission time parameter of the lightning rod (ΔT) and its radius of protection/coverage.

GREATER PROTECTION VOLUME

- Radius of protection up to 120 m
- Savings of over 30% compared to a passive system
- Easy to install and maintain

WHAT ESE MODEL (ΔT) SHOULD BE INSTALLED?

The selection and installation of an ESE type lightning rod is carried out **using risk assessment guidelines**. An effective and safe design requires defining the **level of protection or degree of safety** required, calculating the volume of the facility to be protected and, depending on this, selecting the **appropriate lightning rod** based on its early emission time ΔT .

The table below determines the **radius of protection (R_p)** as a function of the height of the lightning rod above the surface to be protected (h), the value of early emission (ΔT) of each model and the level of protection. This level is determined from the **risk assessment**.

Protection radius [m] according to NF C 17-102:2011

nimbus®

PROJECT DESIGNER

Tool for the complete design of an external lightning protection system.

Comprehensive tool

All the tools you need for facility drawing, risk assessment, optimisation of lightning rod placement and generation of technical documentation integrated into a single piece of software.

SOFTWARE
allinone

nimbus® project designer software

LIGHTNING SYSTEM PROTECTION DESIGN FOR ANY TYPE OF FACILITY

Lightning system protection design software

The **nimbus® project designer** is a **free online tool** which allows users to create the **complete design of a lightning protection system**, from analyzing the risks in accordance with the current regulations, to automatically calculating the optimal number and location of **nimbus®** lightning rods.

The software provides a valuable document detailing the data and calculations for the specification of the project, **facilitating the preparation of quotes.**

The results of the project are compiled in a report that includes general aspects related to the project in question, normative information, definition of the areas and structures to be protected, the exact location of the lightning rods and earthings and an exhaustive list of accessories that make up the lightning protection system (LPS).

This tool aims to **facilitate the process of analysis and calculation of lightning protection** for any type of facility through the installation of lightning rods on the actual structures and/or on self-supporting poles:

- **Small systems** for industry, tertiary sector, residential and municipal buildings, schools, observatories, radars installations, etc.
- **Large retail and industrial complexes**, hotels, logistics hubs, institutional headquarters, rooftop solar systems, sports, leisure and military complexes, etc.
- **Extensive facilities** such as WWTP/ DWTP (water treatment), solar farms, mining and cement facilities, airports, ports, university campuses, etc.

nimbus® 
PROJECT DESIGNER

nimbus.cirprotec.com

Easy, fast and optimised project design

AUTOMATIC LIGHTNING ROD CALCULATION

The **algorithm** developed by Cirprotec allows the **optimal location** of nimbus® lightning rods and earthings **using cost criteria**.

GUIDED PROCESS

Thanks to a linear process, and **guided by an assistant with contextual help**, defining projects becomes a simple task. No previous knowledge is required.

EASY DEFINITION OF THE PROTECTION AREA

Complete and simple drawing tool with drawing import.

RISK ASSESSMENT

Calculations of the level of protection **in accordance with current standards** NF C 17-102:2011, UNE 21186:2018 and CTE SU08.

TECHNICAL SPECIFICATION TOOL

A simple and intuitive interface makes it possible to design the external lightning protection system, while providing a **complete document for the specification of the project**.

BILL OF MATERIALS

Includes **all necessary accessories** for the lightning protection system.

FINAL PROJECT REPORT

nimbus® project designer | Step by step

RESOLVE YOUR PROJECTS RAPIDLY AND INTUITIVELY

nimbus® project designer is an **online software tool** which provides the designer with the necessary tools for the design of lightning protection projects.

A **linear process allows the user to be guided** by the assistant through a set of "stations" which configure the **data and decisions** which determine the scope of the external lightning protection project, in all cases allowing it to be **edited or modified**.

These steps are detailed as follows:

- Project data
- Drawing and parameters
- Risk assesment
- nimbus® optimiser
- Bill of materials
- Project report

More information on cirprotec.com/externa

Project data

The screenshot shows the 'Project data' step in the software. It is divided into three main sections: 'PROJECT DATA', 'NORMATIVE DATA', and 'PROJECT CLIENT DATA'. 'PROJECT DATA' includes fields for 'NAME', 'LOCATION', and a map. 'NORMATIVE DATA' includes 'REFERENCE STANDARD', 'DOWN CONDUCTOR TYPE', 'ACCESSORY SAFETY MARGIN', and 'ICFE PROJECT APPLICABLE TO NF C STANDARD'. 'PROJECT CLIENT DATA' includes 'COMPANY', 'CONTACT PERSON', 'CONTACT E-MAIL', 'E-mail', and 'CONTACT PHONE NUMBER'. A progress bar at the top shows the current step is 'Project data'.

- 1 Name the project and define its geographic location.
- 2 Indicate the regulatory framework and the technical characteristics of the facility.
- 3 Fill in the property details of your customer's facility in order to issue a customized report.

nimbus® optimiser

- 7 Automatically calculate the lightning rod placing to cover the entire area to be protected; also manual option.
- 8 Configure the accessories of each lightning rod and its earthing.

Bill of materials

- 9 The software generates the overall bill of materials (lightning rods and accessories) required for the protection of the comprehensive facility, in addition to a bill of materials for each lightning rod.

Drawing and parameters

Risk assessment

- 4 Import a plan and/or draw the perimeter of the installation and set the scale.
- 5 Draw the structures to be protected and indicate the height and materials for each one.

- 6 For each structure: Select the level of protection or calculate it using the risk calculation wizard.

Final project report

- 10 Download the project report in PDF format together with the related technical data sheets.

- 11 Ready for submitting to the customer.

Design using the most advanced software

FEATURES

nimbus® project designer is the result of **Cirprotec's extensive experience in the design and dimensioning of lightning protection systems**. This software provides the designer with the set of tools needed for the **efficient solution** of projects.

- **Free access for any number of projects**

By just registering, you will have access to all the functions of the software and you can carry out any number of projects, with no limit to the number of lightning rods.

- **Web application**

Since it is a web application it does not require a download or installation, and works on any operating system and browser (optimised for Google Chrome).

- **Multilingual platform**

Both the user interface and the downloadable output files are available in Spanish, English and French. Compatible with scripts (writing systems) other than those of the Latin alphabet.

- **Effective project management and monitoring**

Track the status of the project, edit and recalculate where necessary (by adding restrictions, changing materials, etc.)

- **Step-by-step guided system with contextual help**

Creating projects is based on a linear process. The assistant will guide you through the entire process: import the background plan, draw structures and areas, define the level of protection for each of them, etc., to find a solution for your project quickly and easily. No previous knowledge required.

- **Calculations in accordance with current regulations**

The application performs calculations in accordance with current regulations on ESE lightning protection (NF C 17-102:2011, UNE 21186:2011 and CTE SUA 08), and also provides the possibility of introducing voluntary or prescriptive restrictions on radii of protection according to the laws of each country (ICPE, etc.).

- **Wide portfolio of accessories and materials**

The software includes the complete portfolio of external protection accessories from Cirprotec (See page 24).

The bill of materials provided by the program can be edited to suit the requirements of the project (type of down conductor (cable/flat tape), roof material, type of structure, etc.).

- **Online - always up to date**

Enjoy the most up-to-date version with new and improved features.

The first comprehensive tool | All in one

FUNCTIONS

- **Importing drawings and plans**

Use it as a background reference for drawing areas of the facility to be protected. The tool supports PDF, PNG, JPG formats, etc.

- **Draw your system easily**

The drawing environment has all the necessary tools for the detailed design of the areas and structures to be protected.

- **Risk analysis assistant**

It facilitates risk calculation, provides protection measures (level of protection, surge protection, additional fire and electrical protection) and applies the level of protection to each structure or area.

- **Complete lightning protection design**

From the automatic location of the total number of **lightning rods** and their respective **down conductors** to the selection of installation accessories, including the earthing system.

The location of the lightning rod can be set manually or automatically (thanks to the nimbus® optimiser). It also allows editing of the result provided by the optimiser.

- **nimbus® optimiser**

The calculation and geometric optimisation algorithm developed by Cirprotec provides a compromise between precision, speed and total cost (including all the required accessories for the installation of each lightning rod).

- **Bill of materials**

The accessories needed for the installation are defined automatically according to the location of the lightning rod (roof, wall or ground) and the characteristics of the structure on which it is located.

In the application one can interact with the user interface to show individual lists of materials by lightning rod or to display a summary list of the complete system.

- **Technical specification tool**

The final PDF document includes calculations of the risk analysis, specifications of the location of the lightning rod and earthing, bill of materials, technical product documentation, etc. and facilitates preparation of the project budget/quotation.

nimbus® PRO

IoT smart protection. ESE lightning rod remotely testable from CLOUD, with IoT lightning strike meter/counter up to 200 kA.

cirprotec
CLOUD

nimbus® R

ESE lightning rod with remote test technology using the universal R-Tester (accessory).

nimbus®

ESE lightning rod with early emission streamer according to NF C 17-102 and UNE 21186.

With over 45,000 lightning rods sold, nimbus® is a worldwide leading brand by Cirprotec.

nimbus®

ESE LIGHTNING ROD (WITH ELECTRONIC EARLY STREAMER EMISSION)

nimbus® | Highlights

ESE TECHNOLOGY

The state-of-the-art electronic device (ESE technology) allows the nimbus® lightning rod range to offer the best performance in terms of early emission levels.

IN ACCORDANCE WITH STANDARDS

The lightning rods of the nimbus® series have undergone the tests and quality controls specified in the requirements of standards NF C 17-102:2011 and UNE 21186:2011.

QUALITY ASSURANCE

nimbus® lightning rods are Bureau Veritas certified. This guarantees the type tests, as well as the production process (audited) and ensures quality.

AISI 316 STAINLESS STEEL

Highest quality anti-corrosion stainless steel AISI 316 is used in the manufacture of nimbus® lightning rods.

MAINTENANCE TEST

Inspection and maintenance of LPSs is called for by the regulations. Cirprotec partners offer this service to its customers. The LR-tester (accessory) allows to perform the maintenance test of any nimbus® lightning rod on site.

LR-TESTER

+ 45,000 LIGHTNING RODS

The quality and reliability of the nimbus® series is backed by +25 years of experience of CPT. Over 45.000 lightning rods have been installed worldwide in cooperation with a consolidated global network of highly experienced sales and installation partners, as well as recurring customers.

BEYOND THE STANDARD

The nimbus® series offers a level of robustness well above those required in the standard, thus exceeding the characteristics of similar solutions. Tests carried out at independent laboratories have demonstrated its ability to withstand discharges of up to 200 kA.

LIGHTNING DISCHARGE COUNTER

CDR-401 is the standard open-core lightning strike counter, which can easily be placed around a down tape or down cable.

CDR-401

QR | Verify your nimbus® online

WHY MAY IT BE USEFUL TO VERIFY NIMBUS® WITH A QR CODE?

nimbus® is one of the **most recognized ESE lightning rod brands** in the world thanks to Cirprotec's more than 25 years of experience as a protection specialist, as well as the more than **45,000 lightning rods installed**, which have endured the severest conditions for years and decades.

nimbus® quality is assured, with the product enjoying great trust in the market. Consumers who choose nimbus® can rest assured that they are buying a durable and reliable product at all levels:

- **Certificates in accordance with NF C 17-102:2011 and UNE 21186:2011 standards**
- **Production audited by Bureau Veritas**
- **Current testing exceeding the standard**
- **Materials of the utmost quality and extended warranty**

Cirprotec is the first manufacturer to make available to customers who wish for it a **method for confirming the quality of lightning rods, verifiable prior to installation.**

The customer can have **total peace of mind** regarding the origin/authenticity of the device purchased, which will confirm the quality associated with the **original brand** and avoid the risk of copies.

The inclusion of the **laser-marked QR code** on the body of the product allows to verify the nimbus® quality, simply and quickly, from any smartphone device with an app for reading QR codes.

The QR code includes the **serial number** and encodes it along with a secure <https://> link pointing to the official Cirprotec website at <https://qr.cirprotec.com>. This is the only way to be **certain that the product complies with the specified certifications and regulations, and that it was manufactured according to processes audited by Bureau Veritas.**

VERIFIABLE QUALITY PEACE OF MIND

nimbus® is the **first lightning rod** to provide a secure quality confirmation method based on the **verification of its authenticity.**

Verification must be done on the official Cirprotec website **using a laser-marked QR** on the product body.

VERIFICATION RESULT

nimbus® R | Remotely testable series

REMOTELY TESTABLE LIGHTNING ROD

The nimbus® range consists of various series, 45,000 units of which have been installed in the field worldwide. These lightning rods have withstood for years and decades the most severe weather conditions, proving their sturdiness, durability and quality.

Be that as it may, lightning protection systems – including lightning rods – **are subject to periodic maintenance, the frequency of which depends on regulatory issues, the criticality of the facilities, and their location/exposure.**

Each lightning rod manufacturer makes methods available to the market for testing its correct operation. In fact, some codes and standards even contemplate the possibility of this being done remotely.

In the standard nimbus® series, maintenance is performed using the LR-Tester product, which requires physical access to the lightning rod, at the height at which it is installed.

The **nimbus® R range simplifies this process by incorporating remote verification technology.** This way one can **check its operation**, with the help of a **remote control called R-Tester**, without physically accessing the lightning rod.

This feature, in addition to facilitating and speeding up the maintenance process, results in cost savings. This makes the **nimbus® R** lightning rod especially suitable for installations where circumstances require frequent maintenance at an optimal cost.

FEATURES & BENEFITS

The **R-Tester** is especially indicated for installation professionals and external lightning protection maintenance professionals.

Remote result on the remote control

By means of the connection between R-Tester and the nimbus® R lightning rod, the result is shown on the remote control.

R-Tester is universal

Any nimbus® R lightning rods can be tested from a single remote control serial number. It is not necessary to buy an R-Tester for each lightning rod, which makes it cost effective for both installers and owners.

Long range

The technology incorporated in R-tester and nimbus® R, allows testing, serial number by serial number from great distances, an important aspect for most installations.

Check to validate the installation

Make sure the nimbus® R works correctly right after completing the initial installation.

Reduced maintenance costs

Cost effectiveness. Simplified process.

Peace of mind

It allows periodic maintenance tests without the need to physically access the lightning rod, thus favouring an optimal periodicity.

nimbus® R | Highlights

COMPLIANCE WITH STANDARDS CODES

Lightning rod regulations NFC 17-102:2011 and UNE 21186:2011; as well as series UNE 61000-6 for radiated emissions.

VERIFIABLE QUALITY PEACE OF MIND

nimbus® is the first lightning rod to provide a high-quality confirmation method based on the verification of its authenticity. Verification must be done on the official Cirprotec website using a laser-marked QR on the body of the lightning rod.

LED COMMUNICATION ALERT

When performing a test, a high intensity LED on the lightning rod provides visual verification that the communication between the lightning rod and the remote control is taking place correctly.

RELIABILITY UNDER EXTREME CONDITIONS

The components of the nimbus® R series ensure quality protection, as in the entire nimbus® range. The components related to communication and testing are also of the highest quality. nimbus® runs on a battery which can operate at temperatures down to -30 °C.

Ergonomically designed to withstand hurricane force winds.

This all guarantees the long-term operability and profitability of the projects.

OFF-THE-GRID

It requires no external power as it includes a PV module and a high capacity battery which allows the communication to be powered as well as to make exhaustive tests of the internal operating electronics of the lightning rod (emission and charge).

REMOTE TESTING

Remote test using the universal R-Tester control (accessory), with wide range of RF communication in open areas (> 200 m).

nimbus® PRO | IoT smart protection

SMART LIGHTNING PROTECTION

nimbus® PRO is the nimbus® lightning rod series which includes the **most smart and advanced electronic ESE lightning rods** on the market.

nimbus® PRO incorporates **electronic testing and a lightning strike counter**, along with a smart monitoring system that sends **automated alerts** to the Cirprotec CLOUD.

Communication between one or several lightning rods and the CLOUD system is possible thanks to the nexus gateway. This module is installed inside the building to give access to the CLOUD, via Wifi or Ethernet.

Nexus can also optionally incorporate 3G communications. Lightning rod communication with the gateway is based on radio frequency LPWAN, a long-range technology that allows nimbus® PRO to operate smoothly between indoor and outdoor environments (NLOS - no line of sight).

The nimbus® PRO solution allows access to the installation information from anywhere via the **Cirprotec CLOUD online platform**.

CIRPROTEC CLOUD

Cirprotec CLOUD is the brain of the IoT system, made up of the nimbus® PRO rods at the protected facility. It allows maintenance service providers and/or maintenance departments themselves, to monitor and control any facility from a smartphone or computer.

The platform requires **registration of users and authentication of lightning rods and gateways.**

Authentication is implemented through the serial numbers of the physical devices. All this **ensures the privacy of communications and data.**

All devices related to field protection are organized hierarchically in a logical scheme in the CLOUD, grouped in a single installation.

The **management of data and statistics, the location using GPS coordinates, as well as the programming of automatic tests and alerts**, can be displayed graphically and intuitively **in the CLOUD.**

All this favours maintenance efficiency and maximum continuity of protection.

nimbus® PRO | Highlights

IN ACCORDANCE WITH STANDARDS

Lightning rod standards NF C 17-102:2011 and UNE 21186:2011; as well as the UNE 61000-6 series for radiated emissions.

OFF-THE-GRID

It requires no external power, includes a PV module and a high capacity battery to power the communication as well as to make exhaustive checks of the internal operating electronics of the lightning rod (emission and charge).

NEXUS GATEWAY

Data and connection concentrator module, which can communicate via its radio frequency interface with several lightning rods. Located indoors (not outdoors). Sends information to CLOUD through the local interface via WIFI, ETHERNET or 3G (optional).

SMART LIGHTNING STRIKE COUNTER

Installed right at the beginning of the down conductor (for greater reliability) with current measurement. CLOUD alerts of events including measurement of the discharge current (date, time and intensity).

LPWAN RADIO FREQUENCY COMMUNICATION

Long-range low-consumption technology ideal for occasional connections with light data transfers. Able to operate in NLOS (No Line Of Sight) conditions, passing through obstacles (walls) that typically separate lightning rods (outdoors) from the nexus gateway (indoors). In open field conditions it can reach > 1,000 m.

SECURE CONNECTIVITY

RF communication technology between the lightning rod and nexus, supports several layers of communication security.

In addition, nexus communication to CLOUD is based on https, so this too ensures privacy of data.

CIRPROTEC CLOUD

Online platform through which one can easily access all information about the lightning rods and nexus gateways from any location. Can also program tests and receive event alerts, as well as present statistical data for each lightning rod or facility, etc.

Capture System (air terminal)

nimbus® lightning rod **with early emission system (ESE)**. **More than 45,000** protected facilities around the world.

Adapting piece

For fixing nimbus® in the mast.

Lightning strike counter

It allows **lightning strikes on the facility to be detected**, for the purpose of maintenance, thus ensuring its integrity.

Down conductor system

Set of **clamps and accessories** for the design of the lightning system. Solutions for cable and flat tape.

Earthing system

Elements that ensure a good **dissipation of the energy** from the lightning strike.

Lightning rods & accessories

EXTERNAL PROTECTION PRODUCTS

Early streamer emission (ESE) lightning rods

nimbus®

nimbus® is the series of lightning rods with electronic early streaming emission (ESE). Radius of protection up to 120 m (based on emission times). Complies with standards NF C 17-102:2011, UNE 21186:2011, CTE SU 8.

ESE electronic technology, unlike passive Faradization systems with air terminals, makes active use of atmospheric gradient to generate ionization in order to increase the height of the lightning impact point above the tip of the rod, thus increasing the volume protected. This facilitates the protection of large areas, simplifying and reducing material and installation costs.

The nimbus® lightning rods exceed the requirements of the new version of standard NF C 17-102 v2011, with the goal of making them more robust, without sacrificing their compact size and with a significant weight reduction.

FEATURES AND BENEFITS

- Tested with lightning currents up to 200 kA (10/350 μs).
- Highest Quality: AISI 316 stainless steel and non-expendable components.
- Tested and certified by independent laboratories.
- Bureau Veritas Certification of the production process.
- Easy installation (and transport) thanks to its new design.
- Testable in-situ with the Cirprotec LR tester.

+45.000 lightning rods installed

Lightning discharge counters

CDR-401

CDR-401 is Cirprotec's lightning discharge counter. It complies with the latest applicable Lightning Protection related Standards (UNE-EN 50164-6, UNE-EN 62561-6 and UTE C 17106).

FEATURES AND BENEFITS

- Open core technology: CDR-401 is a "Clip-on" counter that can be installed around the conductor. Ideal also for retrofitting.
- Universal: Installation around flat tapes and cable conductors.
- CDR-401 is totally protected against the effect of dust and against the effect of immersion (IP67).
